### 1 Existence of a Concave Consumption Function

To show that (7) defines a sequence of continuously differentiable strictly increasing concave functions  $\{c_T, c_{T-1}, ..., c_{T-k}\}$ , we start with a definition. We will say that a function n(z) is 'nice' if it satisfies

- 1. n(z) is well-defined iff z > 0
- 2. n(z) is strictly increasing
- 3. n(z) is strictly concave
- 4. n(z) is  $C^{3}$
- 5. n(z) < 0
- 6.  $\lim_{z\downarrow 0} n(z) = -\infty$ .

(Notice that an implication of niceness is that  $\lim_{z\downarrow 0} n'(z) = \infty$ .)

Assume that some  $v_{t+1}$  is nice. Our objective is to show that this implies  $v_t$  is also nice; this is sufficient to establish that  $v_{t-n}$  is nice by induction for all n > 0 because  $v_T(m) = u(m)$  and  $u(m) = m^{1-\rho}/(1-\rho)$  is nice by inspection.

Now define an end-of-period value function  $\mathfrak{v}_t(a)$  as

$$\mathfrak{v}_t(a) = \beta \,\mathbb{E}_t \left[ \Gamma_{t+1}^{1-\rho} \mathbf{v}_{t+1} (\mathcal{R}_{t+1} a + \xi_{t+1}) \right]. \tag{1}$$

Since there is a positive probability that  $\xi_{t+1}$  will attain its minimum of zero and since  $\mathcal{R}_{t+1} > 0$ , it is clear that  $\lim_{a\downarrow 0} \mathfrak{v}_t(a) = -\infty$  and  $\lim_{a\downarrow 0} \mathfrak{v}_t'(a) = \infty$ . So  $\mathfrak{v}_t(a)$  is well-defined iff a > 0; it is similarly straightforward to show the other properties required for  $\mathfrak{v}_t(a)$  to be nice. (See Hiraguchi (2003).)

Next define  $\underline{\mathbf{v}}_t(m,c)$  as

$$\underline{\mathbf{v}}_t(m,c) = \mathbf{u}(c) + \mathbf{v}_t(m-c) \tag{2}$$

which is  $\mathbb{C}^3$  since  $\mathfrak{v}_t$  and u are both  $\mathbb{C}^3$ , and note that our problem's value function defined in (7) can be written as

$$v_t(m) = \max_{c} \ \underline{v}_t(m, c). \tag{3}$$

 $\underline{\mathbf{v}}_t$  is well-defined if and only if 0 < c < m. Furthermore,  $\lim_{c \downarrow 0} \underline{\mathbf{v}}_t(m,c) = \lim_{c \uparrow m} \underline{\mathbf{v}}_t(m,c) = -\infty$ ,  $\frac{\partial^2 \underline{\mathbf{v}}_t(m,c)}{\partial c^2} < 0$ ,  $\lim_{c \downarrow 0} \frac{\partial \underline{\mathbf{v}}_t(m,c)}{\partial c} = +\infty$ , and  $\lim_{c \uparrow m} \frac{\partial \underline{\mathbf{v}}_t(m,c)}{\partial c} = -\infty$ . It follows that the  $\mathbf{c}_t(m)$  defined by

$$c_t(m) = \underset{0 < c < m}{\operatorname{arg max}} \ \underline{\mathbf{v}}_t(m, c) \tag{4}$$

exists and is unique, and (7) has an internal solution that satisfies

$$\mathbf{u}'(\mathbf{c}_t(m)) = \mathbf{v}_t'(m - \mathbf{c}_t(m)). \tag{5}$$

Since both u and  $\mathfrak{v}_t$  are strictly concave, both  $c_t(m)$  and  $a_t(m) = m - c_t(m)$  are strictly increasing. Since both u and  $\mathfrak{v}_t$  are three times continuously differentiable, using (5) we can conclude that  $c_t(m)$  is continuously differentiable and

$$c_t'(m) = \frac{\mathfrak{v}_t''(\mathbf{a}_t(m))}{\mathbf{u}''(\mathbf{c}_t(m)) + \mathfrak{v}_t''(\mathbf{a}_t(m))}.$$
(6)

Similarly we can easily show that  $c_t(m)$  is twice continuously differentiable (as is  $a_t(m)$ ) (See Appendix 2.) This implies that  $v_t(m)$  is nice, since  $v_t(m) = u(c_t(m)) + v_t(a_t(m))$ .

# 2 $c_t(m)$ is Twice Continuously Differentiable

First we show that  $c_t(m)$  is  $\mathbb{C}^1$ . Define y as  $y \equiv m + dm$ . Since  $u'(c_t(y)) - u'(c_t(m)) = \mathfrak{v}'_t(a_t(y)) - \mathfrak{v}'_t(a_t(m))$  and  $\frac{a_t(y) - a_t(m)}{dm} = 1 - \frac{c_t(y) - c_t(m)}{dm}$ ,

$$\frac{\mathbf{v}_t'(\mathbf{a}_t(y)) - \mathbf{v}_t'(\mathbf{a}_t(m))}{\mathbf{a}_t(y) - \mathbf{a}_t(m)} = \left(\frac{\mathbf{u}'(\mathbf{c}_t(y)) - \mathbf{u}'(\mathbf{c}_t(m))}{\mathbf{c}_t(y) - \mathbf{c}_t(m)} + \frac{\mathbf{v}_t'(\mathbf{a}_t(y)) - \mathbf{v}_t'(\mathbf{a}_t(m))}{\mathbf{a}_t(y) - \mathbf{a}_t(m)}\right) \frac{\mathbf{c}_t(y) - \mathbf{c}_t(m)}{dm}$$

Since  $c_t$  and  $a_t$  are continuous and increasing,  $\lim_{dm \to +0} \frac{u'(c_t(y)) - u'(c_t(m))}{c_t(y) - c_t(m)} < 0$  and  $\lim_{dm \to +0} \frac{v'_t(a_t(y)) - v'_t(a_t(m))}{a_t(y) - a_t(m)} < 0$  are satisfied. Then  $\frac{u'(c_t(y)) - u'(c_t(m))}{c_t(y) - c_t(m)} + \frac{v'_t(a_t(y)) - v'_t(a_t(m))}{a_t(y) - a_t(m)} < 0$  for sufficiently small dm. Hence we obtain a well-defined equation:

$$\frac{c_t(y) - c_t(m)}{dm} = \frac{\frac{v_t'(a_t(y)) - v_t'(a_t(m))}{a_t(y) - a_t(m)}}{\frac{u'(c_t(y)) - u'(c_t(m))}{c_t(y) - c_t(m)} + \frac{v_t'(a_t(y)) - v_t'(a_t(m))}{a_t(y) - a_t(m)}}.$$

This implies that the right-derivative,  $c_t^{\prime+}(m)$  is well-defined and

$$c_t'^+(m) = \frac{\mathfrak{v}_t''(\mathbf{a}_t(m))}{\mathbf{u}''(\mathbf{c}_t(m)) + \mathfrak{v}_t''(\mathbf{a}_t(m))}.$$

Similarly we can show that  $c_t'^+(m) = c_t'^-(m)$ , which means  $c_t'(m)$  exists. Since  $\mathfrak{v}_t$  is  $\mathbb{C}^3$ ,  $c_t'(m)$  exists and is continuous.  $c_t'(m)$  is differentiable because  $\mathfrak{v}_t''$  is  $\mathbb{C}^1$ ,  $c_t(m)$  is  $\mathbb{C}^1$  and  $u''(c_t(m)) + \mathfrak{v}_t''(a_t(m)) < 0$ .  $c_t''(m)$  is given by

$$c_t''(m) = \frac{a_t'(m)\mathfrak{v}_t'''(a_t)\left[u''(c_t) + \mathfrak{v}_t''(a_t)\right] - \mathfrak{v}_t''(a_t)\left[c_t'u'''(c_t) + a_t'\mathfrak{v}_t'''(a_t)\right]}{\left[u''(c_t) + \mathfrak{v}_t''(a_t)\right]^2}.$$
 (7)

Since  $\mathfrak{v}''_t(\mathbf{a}_t(m))$  is continuous,  $\mathbf{c}''_t(m)$  is also continuous.

## 3 Proof that T Is a Contraction Mapping

We must show that our operator  $\mathfrak{T}$  satisfies all of Boyd's conditions.

Boyd's operator T maps from  $C_F(\mathcal{A}, \mathcal{B})$  to  $C(\mathcal{A}, \mathcal{B})$ . A preliminary requirement is therefore that  $\{\Im z\}$  be continuous for any F-bounded z,  $\{\Im z\} \in C(\mathbb{R}_{++}, \mathbb{R})$ . This is not difficult to show; see Hiraguchi (2003).

Consider condition (1). For this problem,

$$\begin{aligned} & \{ \Im \mathbf{x} \}(m_t) \text{ is } \max_{c_t \in [\underline{\kappa}m_t, \bar{\kappa}m_t]} \left\{ \mathbf{u}(c_t) + \beta \, \mathbb{E}_t \left[ \Gamma_{t+1}^{1-\rho} \mathbf{x} \left( m_{t+1} \right) \right] \right\} \\ & \{ \Im \mathbf{y} \}(m_t) \text{ is } \max_{c_t \in [\underline{\kappa}m_t, \bar{\kappa}m_t]} \left\{ \mathbf{u}(c_t) + \beta \, \mathbb{E}_t \left[ \Gamma_{t+1}^{1-\rho} \mathbf{y} \left( m_{t+1} \right) \right] \right\}, \end{aligned}$$

so  $\mathbf{x}(\bullet) \leq \mathbf{y}(\bullet)$  implies  $\{\Im \mathbf{x}\}(m_t) \leq \{\Im \mathbf{y}\}(m_t)$  by inspection.<sup>1</sup> Condition (2) requires that  $\{\Im \mathbf{0}\} \in \mathcal{C}_F(\mathcal{A}, \mathcal{B})$ . By definition,

$$\{\mathfrak{T}\mathbf{0}\}(m_t) = \max_{c_t \in [\underline{\kappa}m_t, \bar{\kappa}m_t]} \left\{ \left(\frac{c_t^{1-\rho}}{1-\rho}\right) + \beta 0 \right\}$$

the solution to which is patently  $u(\bar{\kappa}m_t)$ . Thus, condition (2) will hold if  $(\bar{\kappa}m_t)^{1-\rho}$  is F-bounded. We use the bounding function

$$F(m) = \eta + m^{1-\rho},\tag{8}$$

for some real scalar  $\eta > 0$  whose value will be determined in the course of the proof. Under this definition of F,  $\{\mathfrak{T}\mathbf{0}\}(m_t) = \mathbf{u}(\bar{\kappa}m_t)$  is clearly F-bounded.

Finally, we turn to condition (3),  $\{\mathcal{T}(z+\zeta F)\}(m_t) \leq \{\mathcal{T}z\}(m_t) + \zeta \alpha F(m_t)$ . The proof will be more compact if we define  $\check{c}$  and  $\check{a}$  as the consumption and assets functions<sup>2</sup> associated with  $\mathcal{T}(z+\zeta F)$ ; using this notation, condition (3) can be rewritten

$$u(\hat{c}) + \beta \{ E(z + \zeta F) \} (\hat{a}) \le u(\check{c}) + \beta \{ Ez \} (\check{a}) + \zeta \alpha F.$$

Now note that if we force the  $\smile$  consumer to consume the amount that is optimal for the  $\land$  consumer, value for the  $\smile$  consumer must decline (at least weakly). That is,

$$u(\hat{c}) + \beta \{Ez\}(\hat{a}) \le u(\check{c}) + \beta \{Ez\}(\check{a}).$$

Thus, condition (3) will certainly hold under the stronger condition

$$\begin{aligned} \mathbf{u}(\hat{\mathbf{c}}) + \beta \{ \mathsf{E}(\mathbf{z} + \zeta F) \}(\hat{\mathbf{a}}) &\leq \mathbf{u}(\hat{\mathbf{c}}) + \beta \{ \mathsf{E}\mathbf{z} \}(\hat{\mathbf{a}}) + \zeta \alpha F \\ \beta \{ \mathsf{E}(\mathbf{z} + \zeta F) \}(\hat{\mathbf{a}}) &\leq \beta \{ \mathsf{E}\mathbf{z} \}(\hat{\mathbf{a}}) + \zeta \alpha F \\ \beta \zeta \{ \mathsf{E}F \}(\hat{\mathbf{a}}) &\leq \zeta \alpha F \\ \beta \{ \mathsf{E}F \}(\hat{\mathbf{a}}) &\leq \alpha F \\ \beta \{ \mathsf{E}F \}(\hat{\mathbf{a}}) &\leq F . \end{aligned}$$

where the last line follows because  $0 < \alpha < 1$  by assumption.<sup>3</sup>

Using  $F(m) = \eta + m^{1-\rho}$  and defining  $\hat{a}_t = \hat{a}(m_t)$ , this condition is

$$\beta \, \mathbb{E}_t [\Gamma_{t+1}^{1-\rho} (\hat{a}_t \mathcal{R}_{t+1} + \xi_{t+1})^{1-\rho}] - m_t^{1-\rho} < \eta (1 - \underbrace{\beta \, \mathbb{E}_t \, \Gamma_{t+1}^{1-\rho}})$$

which by imposing PF-FVAC (equation (25), which says  $\beth < 1$ ) can be rewritten as:

$$\eta > \frac{\beta \mathbb{E}_{t} \left[ \Gamma_{t+1}^{1-\rho} (\hat{a}_{t} \mathcal{R}_{t+1} + \xi_{t+1})^{1-\rho} \right] - m_{t}^{1-\rho}}{1 - \beth}.$$
 (9)

But since  $\eta$  is an arbitrary constant that we can pick, the proof thus reduces to showing

<sup>&</sup>lt;sup>1</sup>For a fixed  $m_t$ , recall that  $m_{t+1}$  is just a function of  $c_t$  and the stochastic shocks.

<sup>&</sup>lt;sup>2</sup>Section 1.7 proves existence of a continuously differentiable consumption function, which implies the existence of a corresponding continuously differentiable assets function.

<sup>&</sup>lt;sup>3</sup>The remainder of the proof could be reformulated using the second-to-last line at a small cost to intuition.

that the numerator of (9) is bounded from above:

$$(1 - \wp)\beta \mathbb{E}_{t} \left[ \Gamma_{t+1}^{1-\rho} (\hat{a}_{t} \mathcal{R}_{t+1} + \theta_{t+1}/(1 - \wp))^{1-\rho} \right] + \wp\beta \mathbb{E}_{t} \left[ \Gamma_{t+1}^{1-\rho} (\hat{a}_{t} \mathcal{R}_{t+1})^{1-\rho} \right] - m_{t}^{1-\rho}$$

$$\leq (1 - \wp)\beta \mathbb{E}_{t} \left[ \Gamma_{t+1}^{1-\rho} ((1 - \bar{\kappa}) m_{t} \mathcal{R}_{t+1} + \theta_{t+1}/(1 - \wp))^{1-\rho} \right] + \wp\beta R^{1-\rho} ((1 - \bar{\kappa}) m_{t})^{1-\rho} - m_{t}^{1-\rho}$$

$$= (1 - \wp)\beta \mathbb{E}_{t} \left[ \Gamma_{t+1}^{1-\rho} ((1 - \bar{\kappa}) m_{t} \mathcal{R}_{t+1} + \theta_{t+1}/(1 - \wp))^{1-\rho} \right] + m_{t}^{1-\rho} \left( \wp\beta R^{1-\rho} \left( \wp^{1/\rho} \frac{(R\beta)^{1/\rho}}{R} \right)^{1-\rho} - 1 \right)$$

$$= (1 - \wp)\beta \mathbb{E}_{t} \left[ \Gamma_{t+1}^{1-\rho} ((1 - \bar{\kappa}) m_{t} \mathcal{R}_{t+1} + \theta_{t+1}/(1 - \wp))^{1-\rho} \right] + m_{t}^{1-\rho} \left( \wp^{1/\rho} \frac{(R\beta)^{1/\rho}}{R} - 1 \right)$$

$$< (1 - \wp)\beta \mathbb{E}_{t} \left[ \Gamma_{t+1}^{1-\rho} (\underline{\theta}/(1 - \wp))^{1-\rho} \right] = \mathbf{\Box} (1 - \wp)^{\rho} \underline{\theta}^{1-\rho}.$$

We can thus conclude that equation (9) will certainly hold for any:

$$\eta > \underline{\eta} = \frac{\beth (1 - \wp)^{\rho} \underline{\theta}^{1 - \rho}}{1 - \beth} \tag{10}$$

which is a positive finite number under our assumptions.

The proof that  $\mathcal{T}$  defines a contraction mapping under the conditions (42) and (39) is now complete.

#### $3.1 \, \mathrm{T} \, \mathrm{and} \, \mathrm{v}$

In defining our operator  $\mathcal{T}$  we made the restriction  $\underline{\kappa}m_t \leq c_t \leq \overline{\kappa}m_t$ . However, in the discussion of the consumption function bounds, we showed only (in (43)) that  $\underline{\kappa}_t m_t \leq c_t(m_t) \leq \overline{\kappa}_t m_t$ . (The difference is in the presence or absence of time subscripts on the MPC's.) We have therefore not proven (yet) that the sequence of value functions (7) defines a contraction mapping.

Fortunately, the proof of that proposition is identical to the proof above, except that we must replace  $\bar{\kappa}$  with  $\bar{\kappa}_{T-1}$  and the WRIC must be replaced by a slightly stronger (but still quite weak) condition. The place where these conditions have force is in the step at (10). Consideration of the prior two equations reveals that a sufficient stronger condition is

$$\wp\beta(\mathsf{R}(1-\bar{\kappa}_{T-1}))^{1-\rho} < 1$$
$$(\wp\beta)^{1/(1-\rho)}(1-\bar{\kappa}_{T-1}) > 1$$
$$(\wp\beta)^{1/(1-\rho)}(1-(1+\wp^{1/\rho}\mathbf{p}_{\mathsf{R}})^{-1}) > 1$$

where we have used (41) for  $\bar{\kappa}_{T-1}$  (and in the second step the reversal of the inequality occurs because we have assumed  $\rho > 1$  so that we are exponentiating both sides by the negative number  $1 - \rho$ ). To see that this is a weak condition, note that for small values of  $\wp$  this expression can be further simplified using  $(1 + \wp^{1/\rho} \mathbf{p}_R)^{-1} \approx 1 - \wp^{1/\rho} \mathbf{p}_R$  so that it becomes

$$(\wp\beta)^{1/(1-\rho)}\wp^{1/\rho}\mathbf{p}_{\mathsf{R}} > 1$$

$$(\wp\beta)\wp^{(1-\rho)/\rho}\mathbf{P}_{\mathsf{R}}^{1-\rho} < 1$$
$$\beta\wp^{1/\rho}\mathbf{P}_{\mathsf{R}}^{1-\rho} < 1.$$

Calling the weak return patience factor  $\mathbf{p}_{\mathsf{R}}^{\wp} = \wp^{1/\rho} \mathbf{p}_{\mathsf{R}}$  and recalling that the WRIC was  $\mathbf{p}_{\mathsf{R}}^{\wp} < 1$ , the expression on the LHS above is  $\beta \mathbf{p}_{\mathsf{R}}^{-\rho}$  times the WRPF. Since we usually assume  $\beta$  not far below 1 and parameter values such that  $\mathbf{p}_{\mathsf{R}} \approx 1$ , this condition is clearly not very different from the WRIC.

The upshot is that under these slightly stronger conditions the value functions for the original problem define a contraction mapping with a unique v(m). But since  $\lim_{n\to\infty}\underline{\kappa}_{T-n}=\underline{\kappa}$  and  $\lim_{n\to\infty}\bar{\kappa}_{T-n}=\bar{\kappa}$ , it must be the case that the v(m) toward which these  $v_{T-n}$ 's are converging is the same v(m) that was the endpoint of the contraction defined by our operator  $\mathfrak{T}$ . Thus, under our slightly stronger (but still quite weak) conditions, not only do the value functions defined by (7) converge, they converge to the same unique v defined by v.

<sup>&</sup>lt;sup>4</sup>It seems likely that convergence of the value functions for the original problem could be proven even if only the WRIC were imposed; but that proof is not an essential part of the enterprise of this paper and is therefore left for future work.
